May 15, 2019

Harnack Haus, Berlin

Satellite meeting

Mortality data and methodological approaches in
estimating mortality in developing countries

Sponsored by Max Planck Institute for Demographic Research

Overview

- **Background**
- **Data sources & challenges**
- **Mortality trends and variation**

Socioeconomic background

- **Economic growth**
 - Changes in nutrition and consumption
- **Social transformation**
 - Individual awareness and life style
- **Establishment of “new” social welfare system**
 - Healthcare and delivery
 - Public health investment

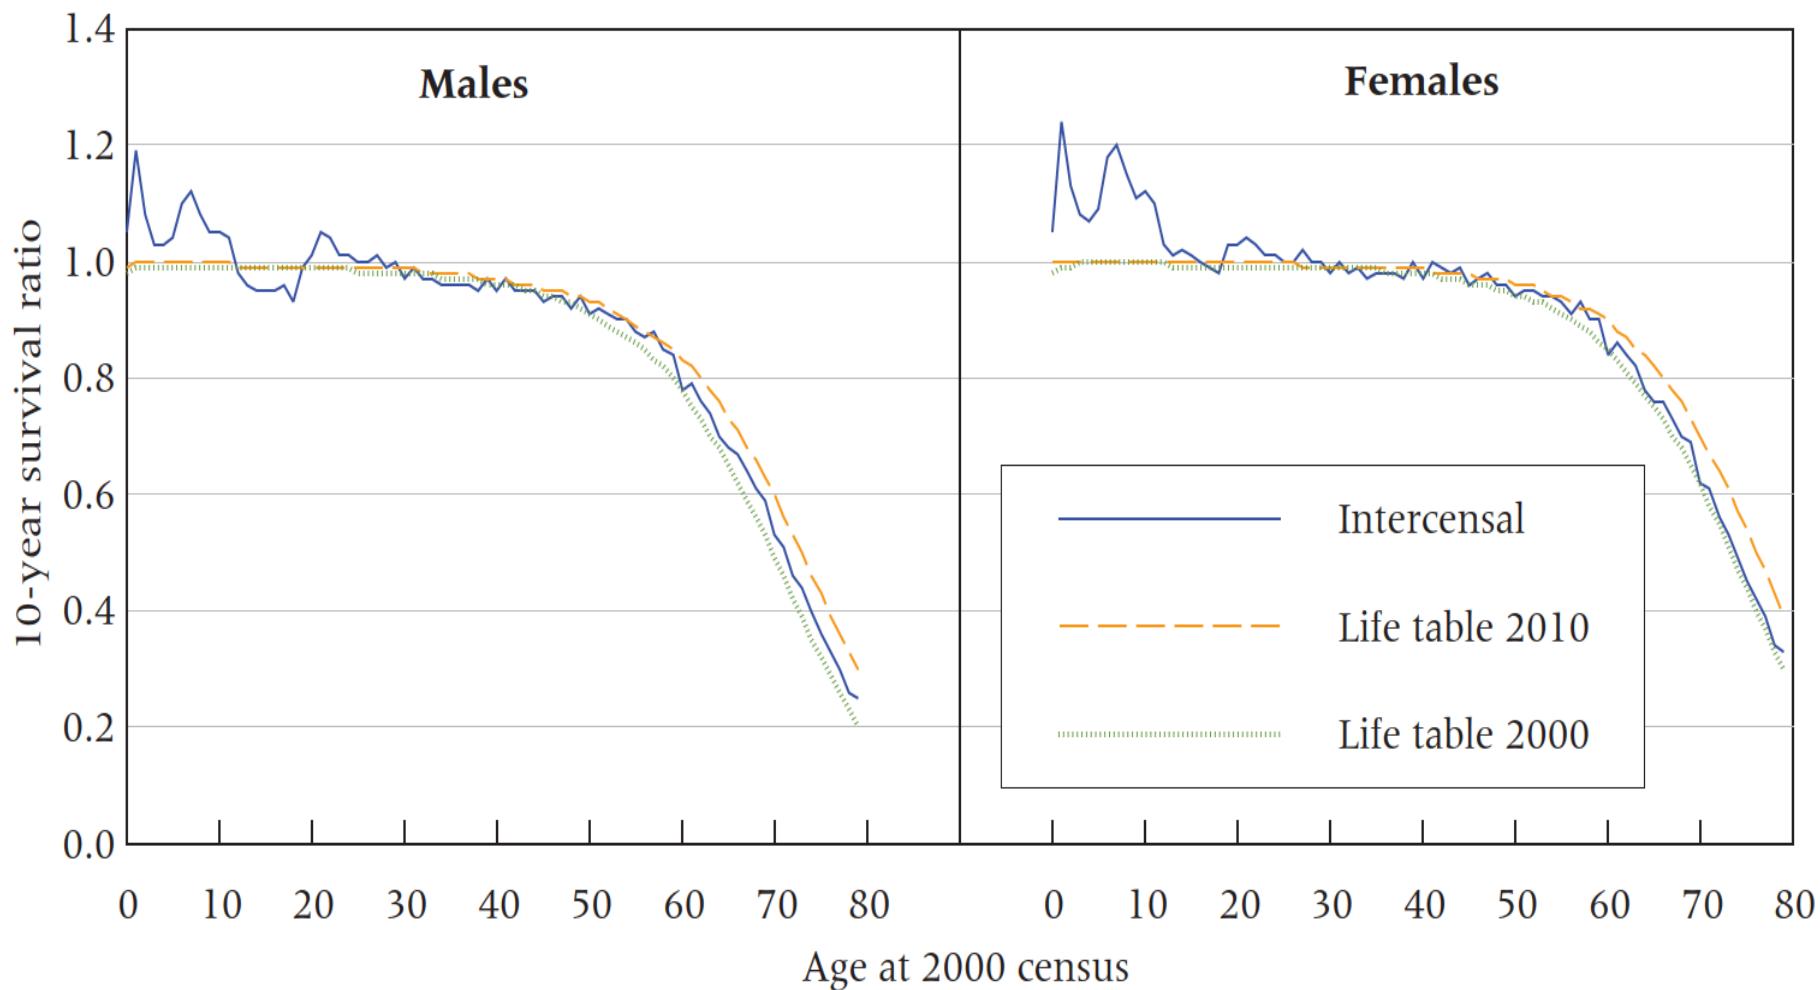

Data sources and challenges

- **Main sources**
 - Population census and surveys
 - Health surveillance systems
 - Death registration
 - Household registration (Hukou)
 - Social pension system
- **Main challenges**
 - Data quality
 - Underreporting
 - Migration
 - Government evaluation
 - Data availability
 - Segmentation
 - Undocumented adjustment

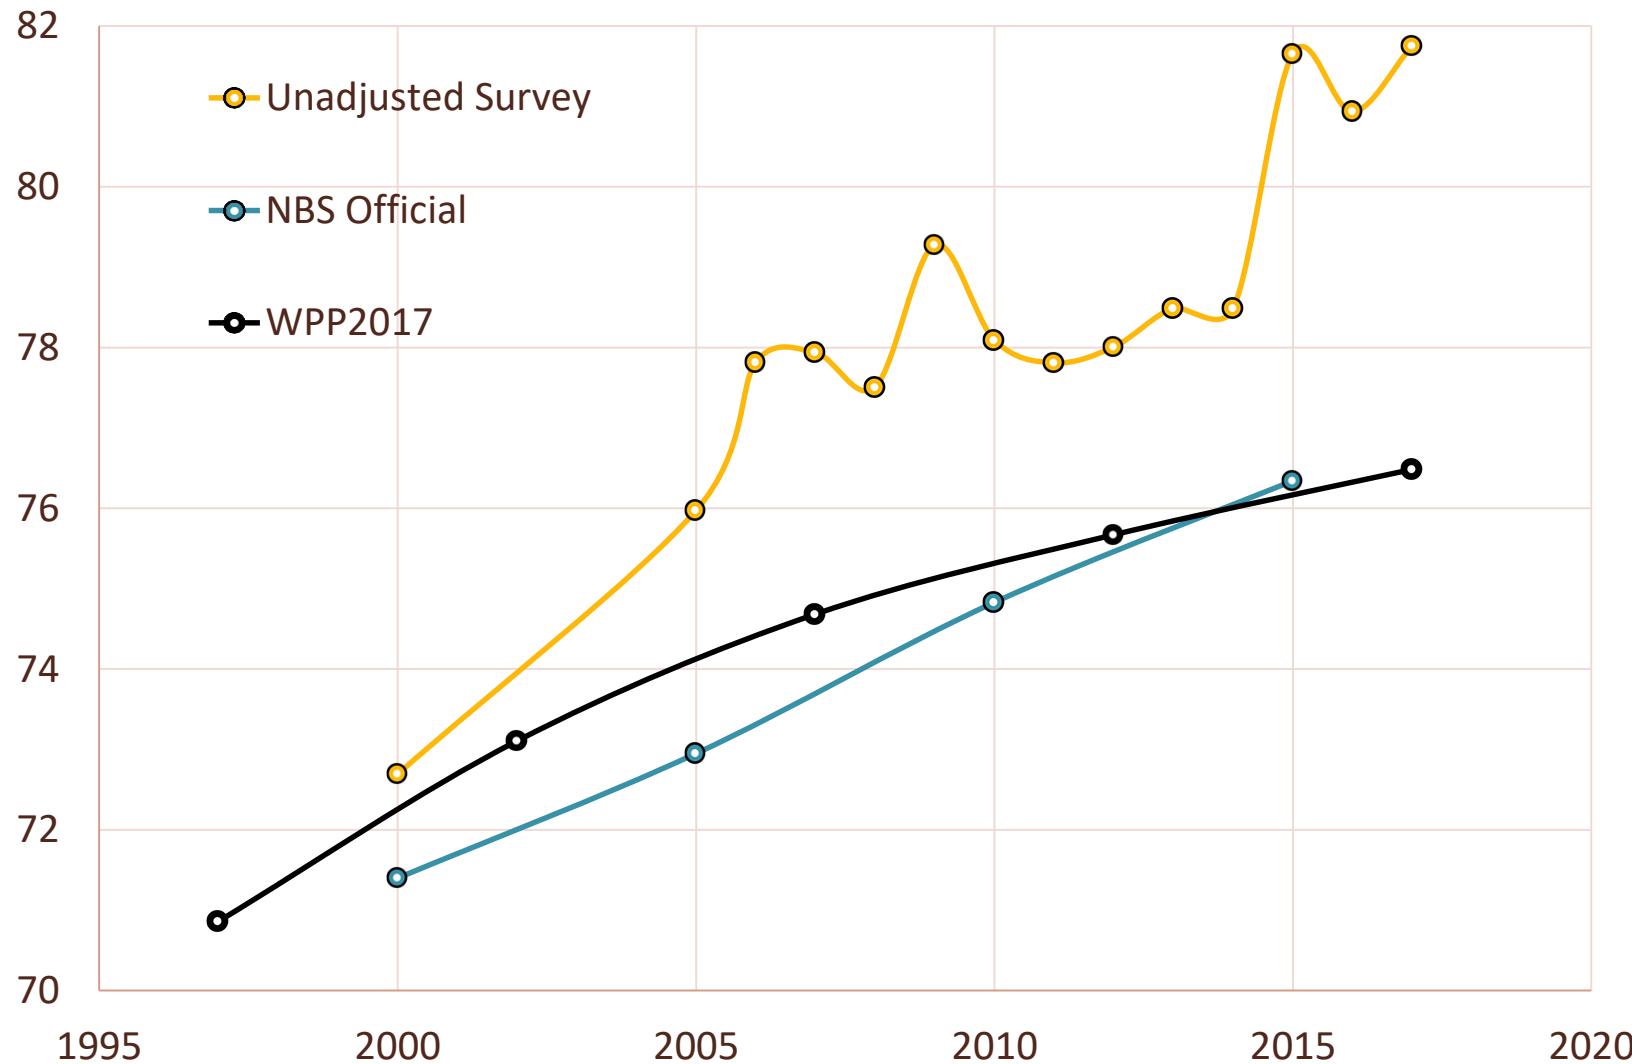

Chinese data: good and bad

FIGURE 2 Intercensal survival ratio by sex and birth cohort, China 2000–2010

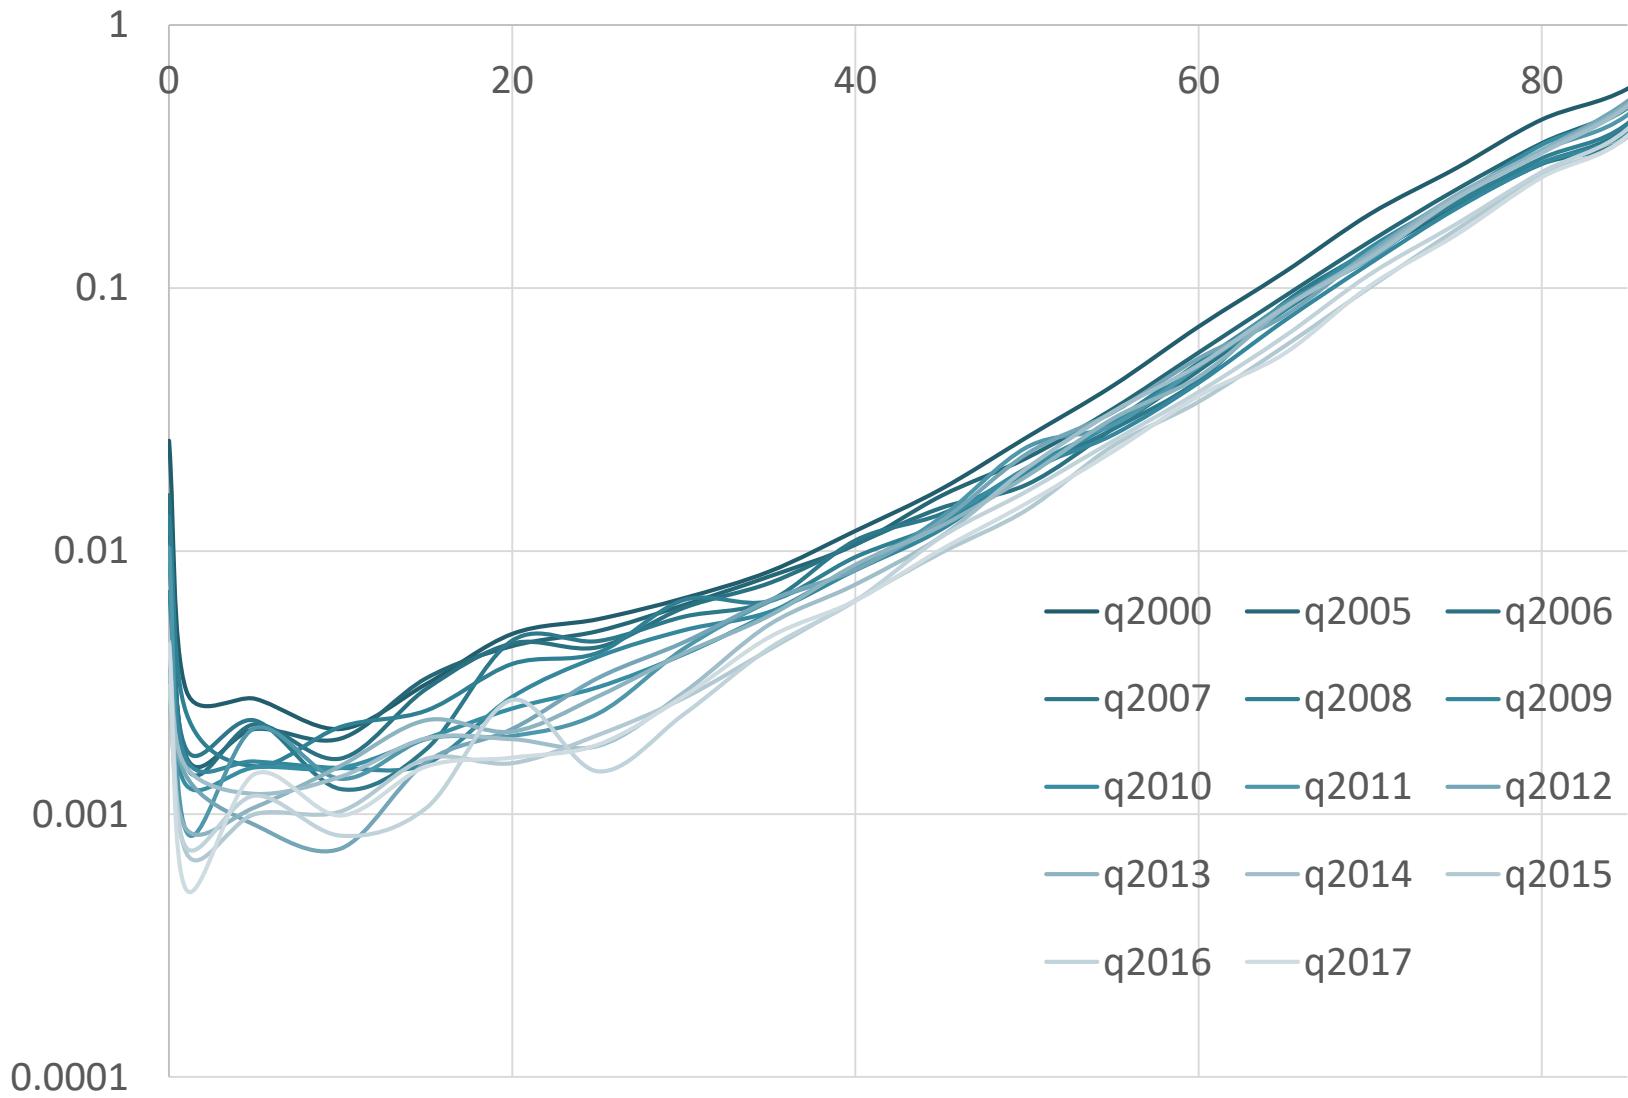

Mortality trends: e_0^t

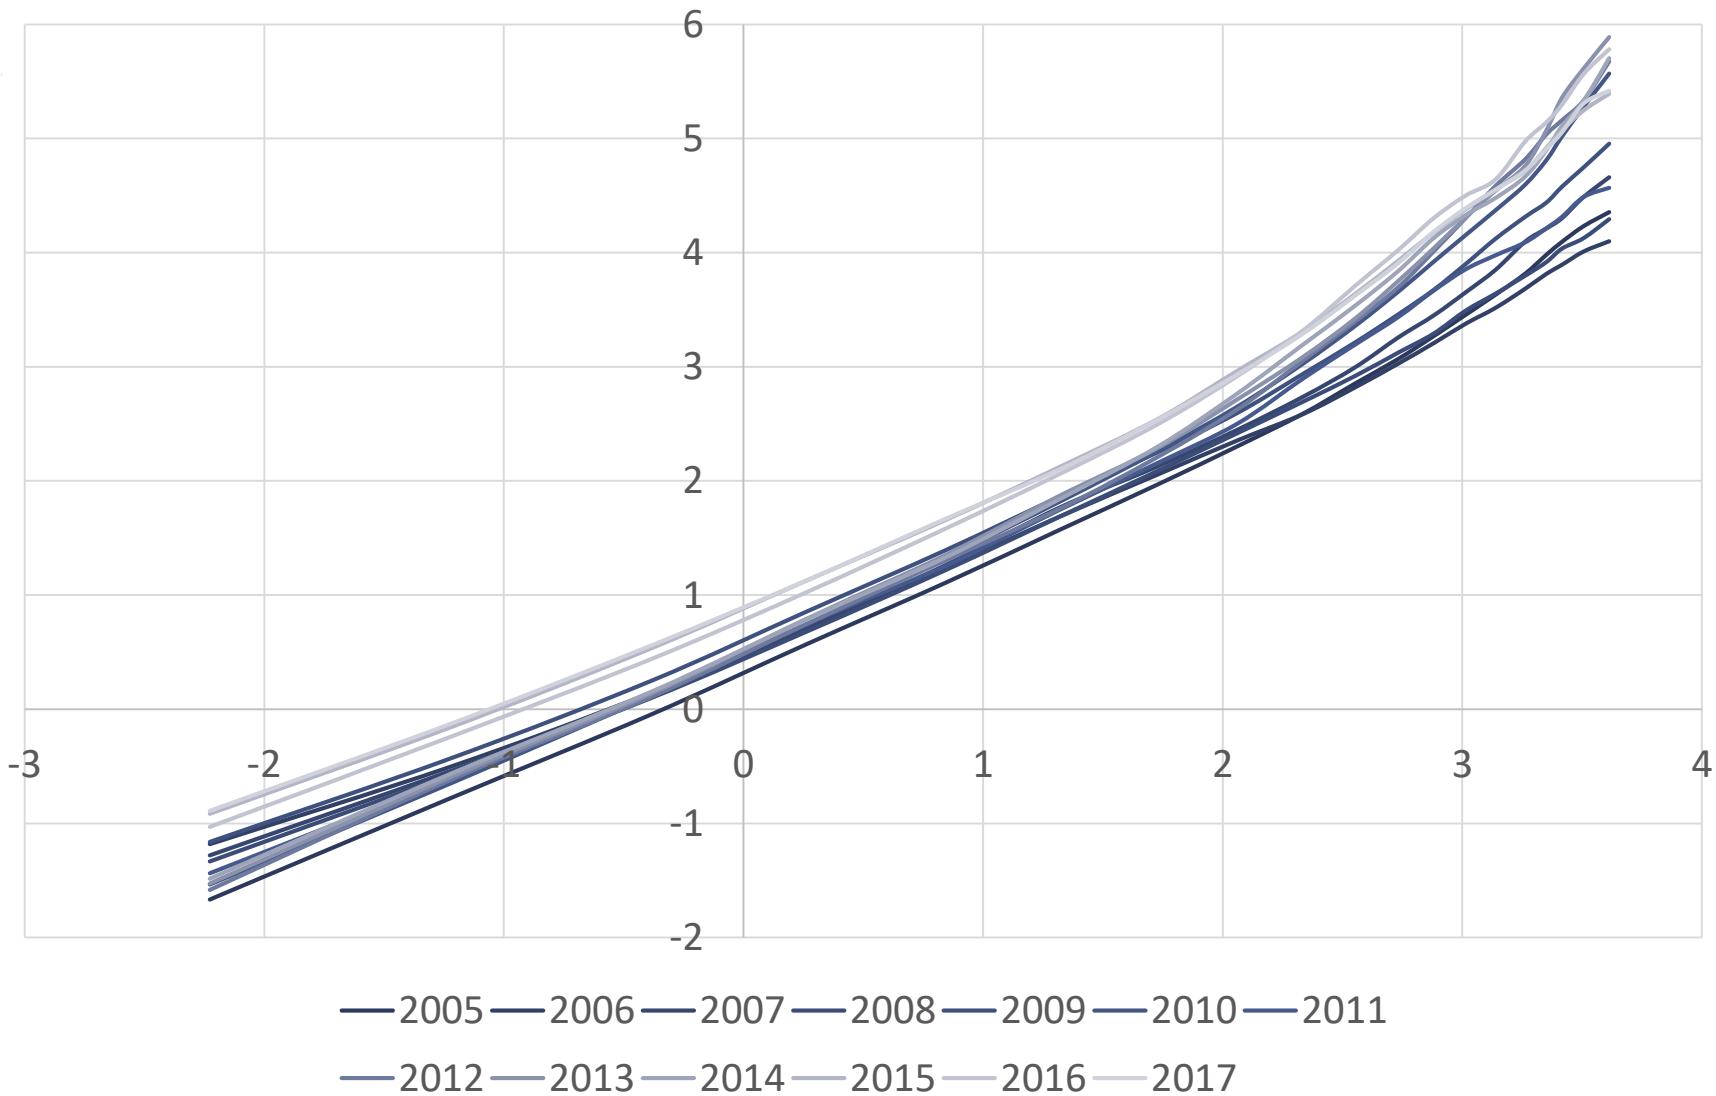

Mortality trends: \underline{q}_x^t

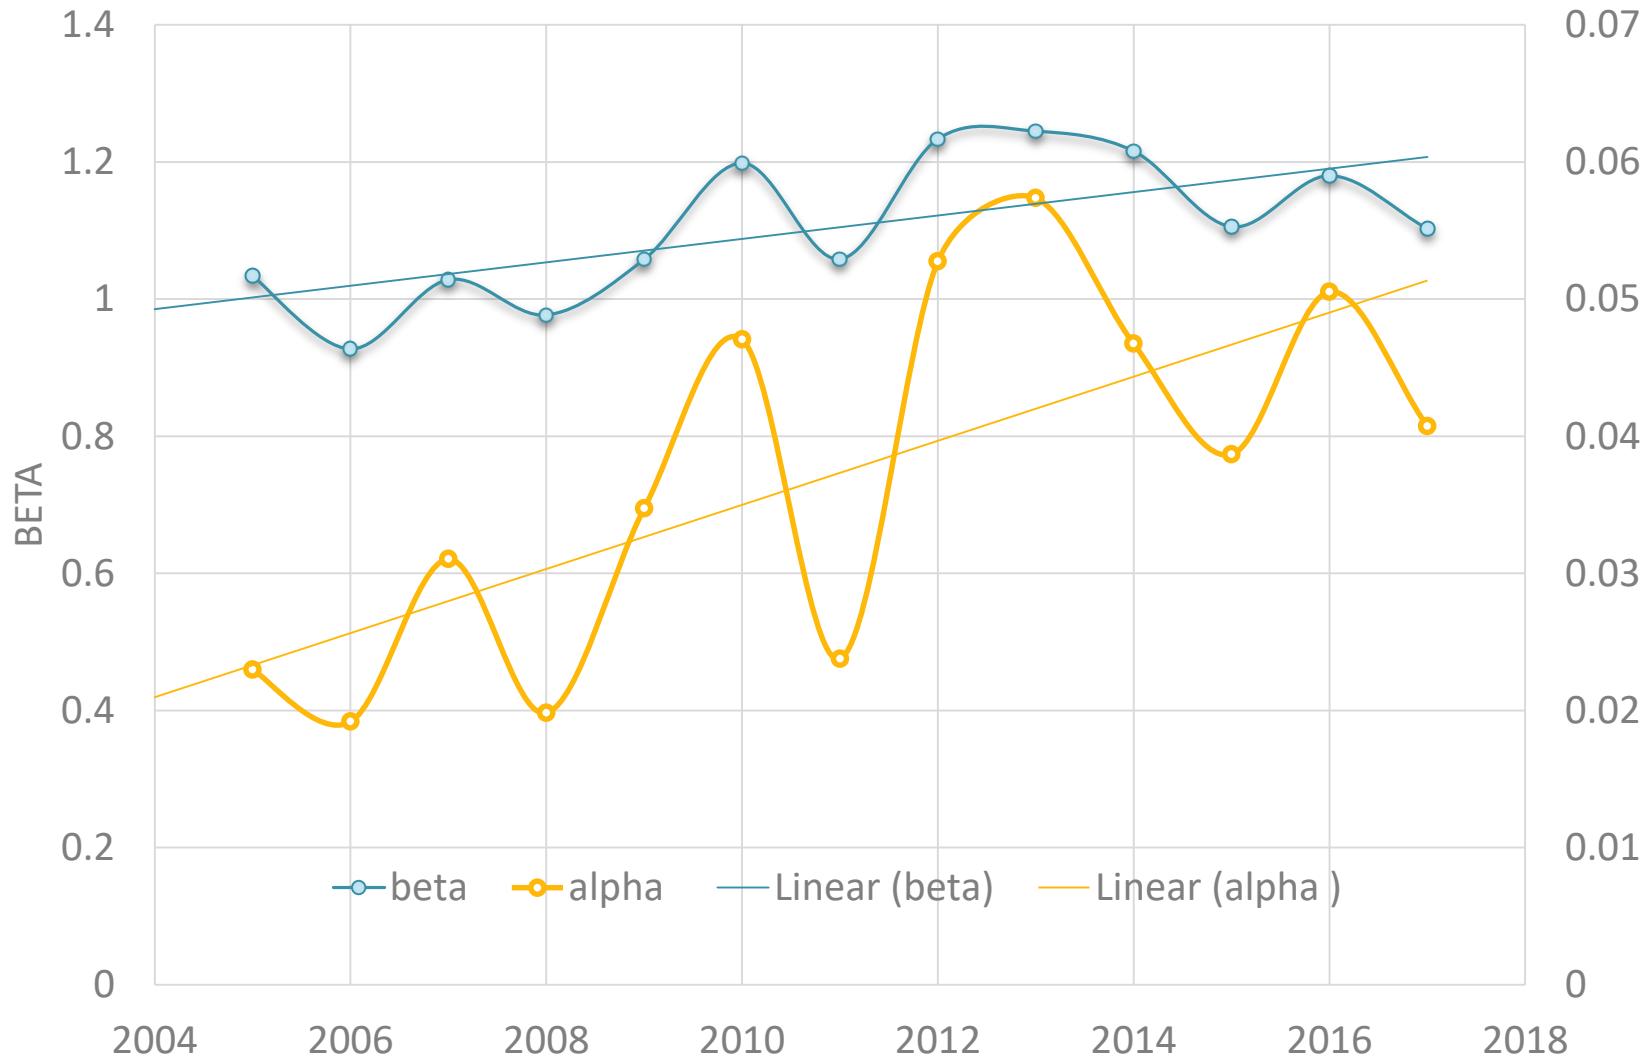

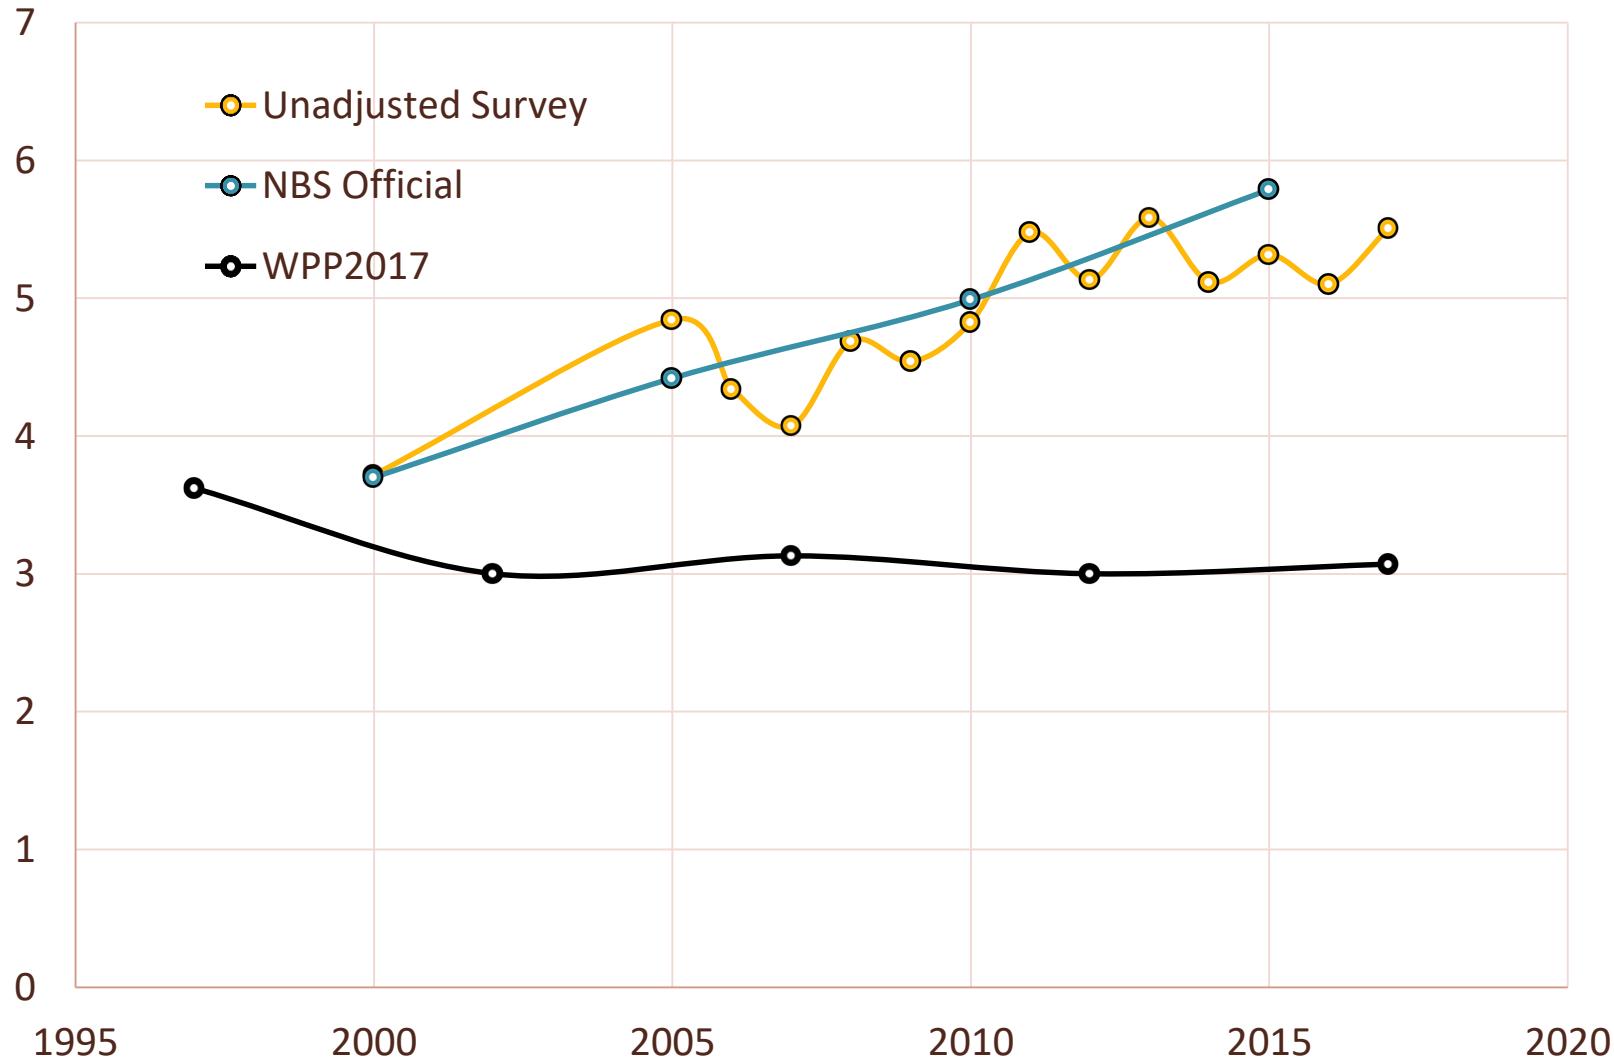

Mortality trends: $\lg t(l_x^t)$ compared to 2000

Mortality trends: $\lg t(l_x^t)$ compared to 2000

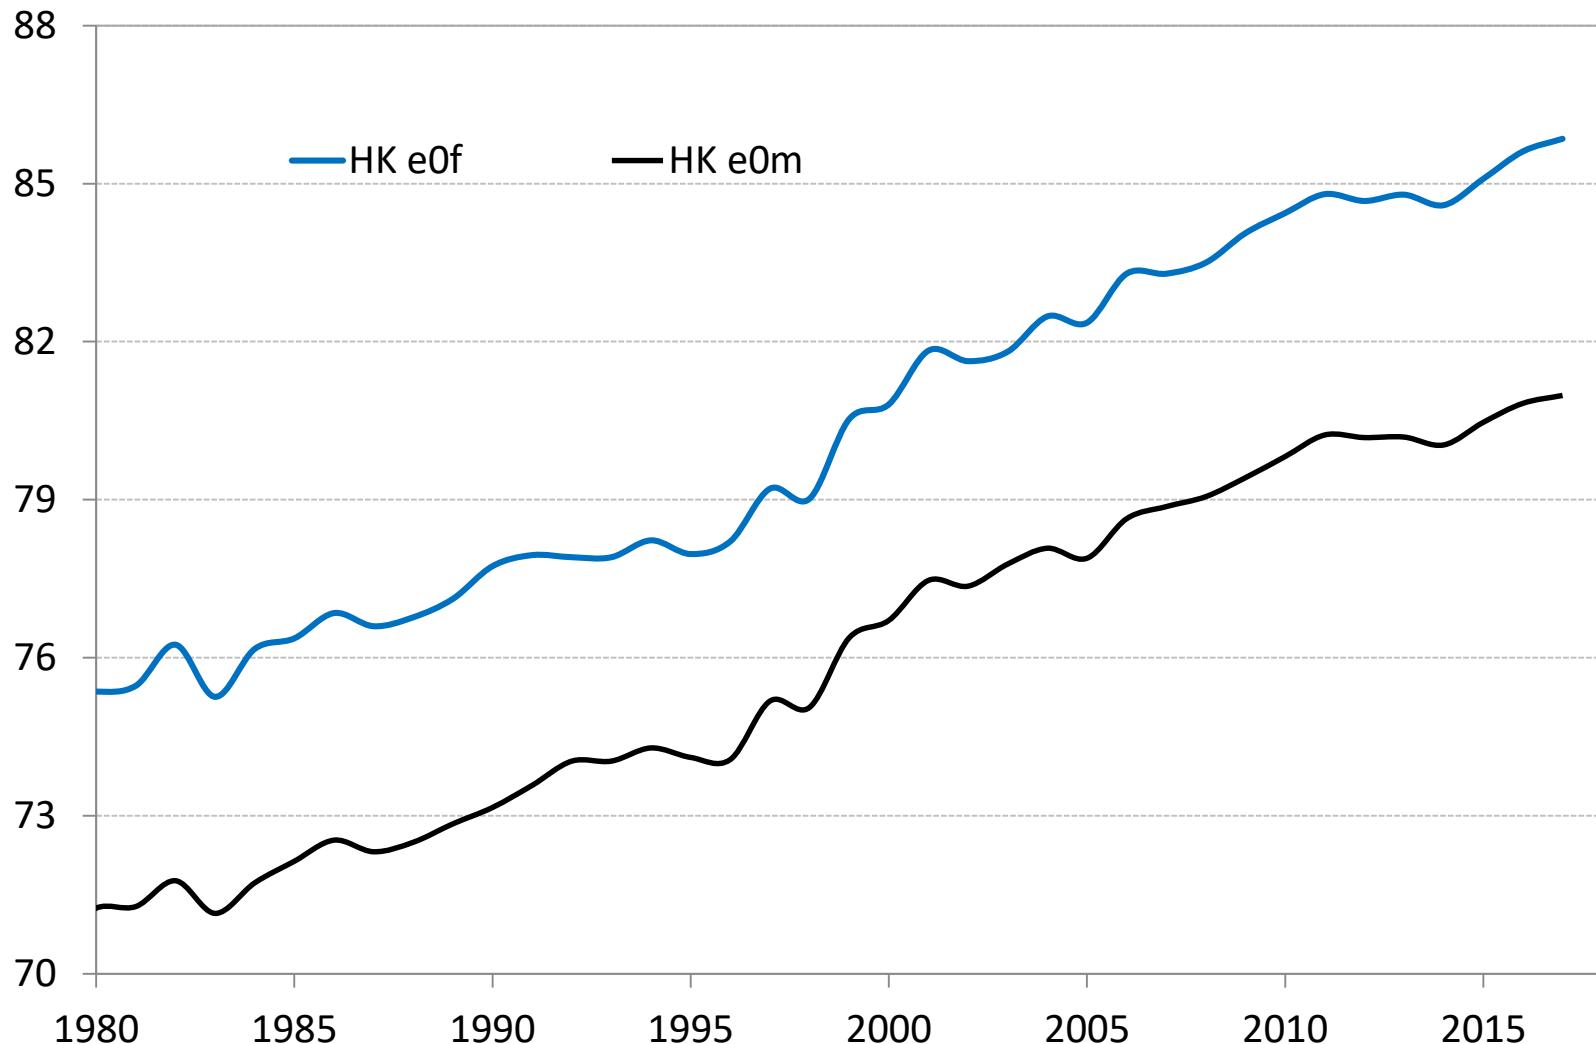

Mortality trends: gender gap $e_0^f - e_0^m$

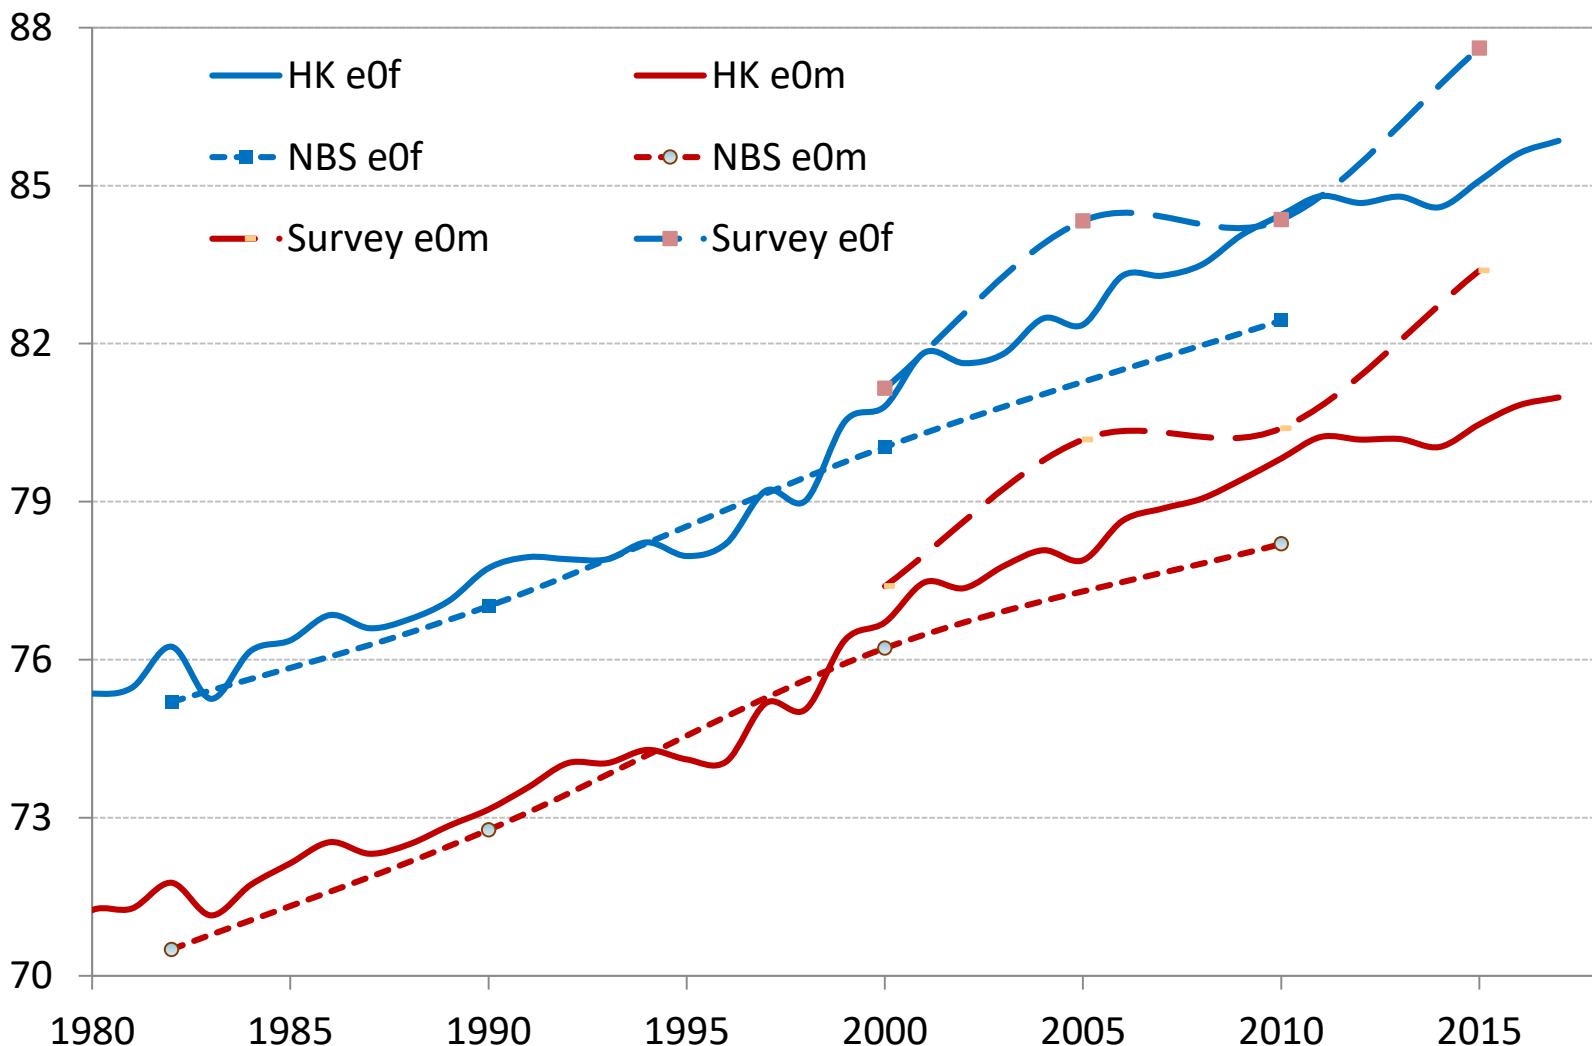

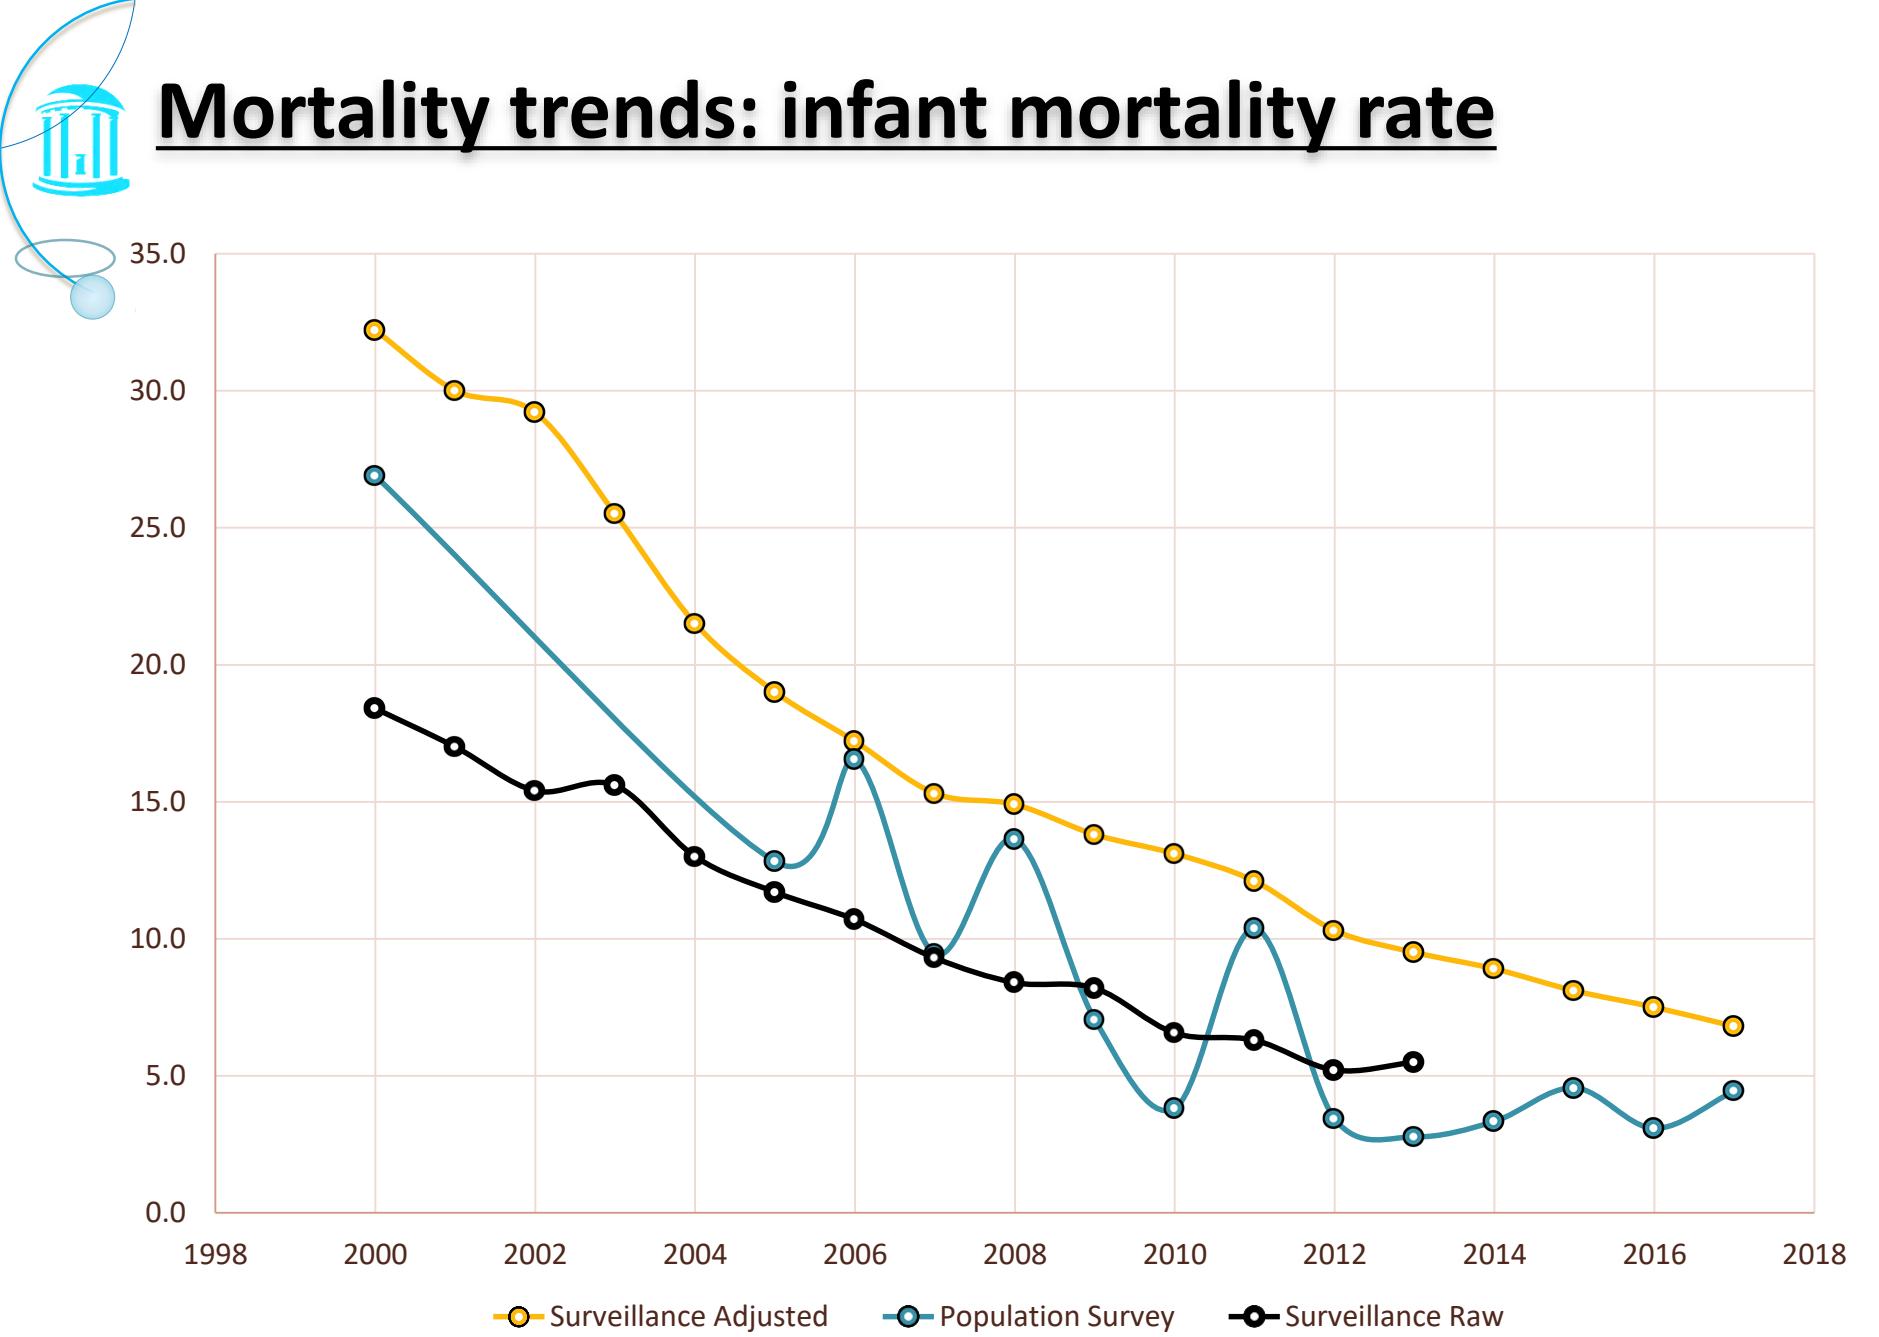

Morality trends: Shanghai e_0

Morality trends: Shanghai e_0

Mortality trends: infant mortality rate

Mortality trends: basic observations

- **Rising life expectancy fits well with the general pattern of mortality decline as it was driven by multiple factors happening in China: socioeconomic development, investment in public health, change of life style...**
- **Mortality underreporting is a constant problem, and will remain to be.**
- **While overall mortality decline can be collaborated with other data sources, ascertain of mortality level requires careful cross-examination with other population data.**

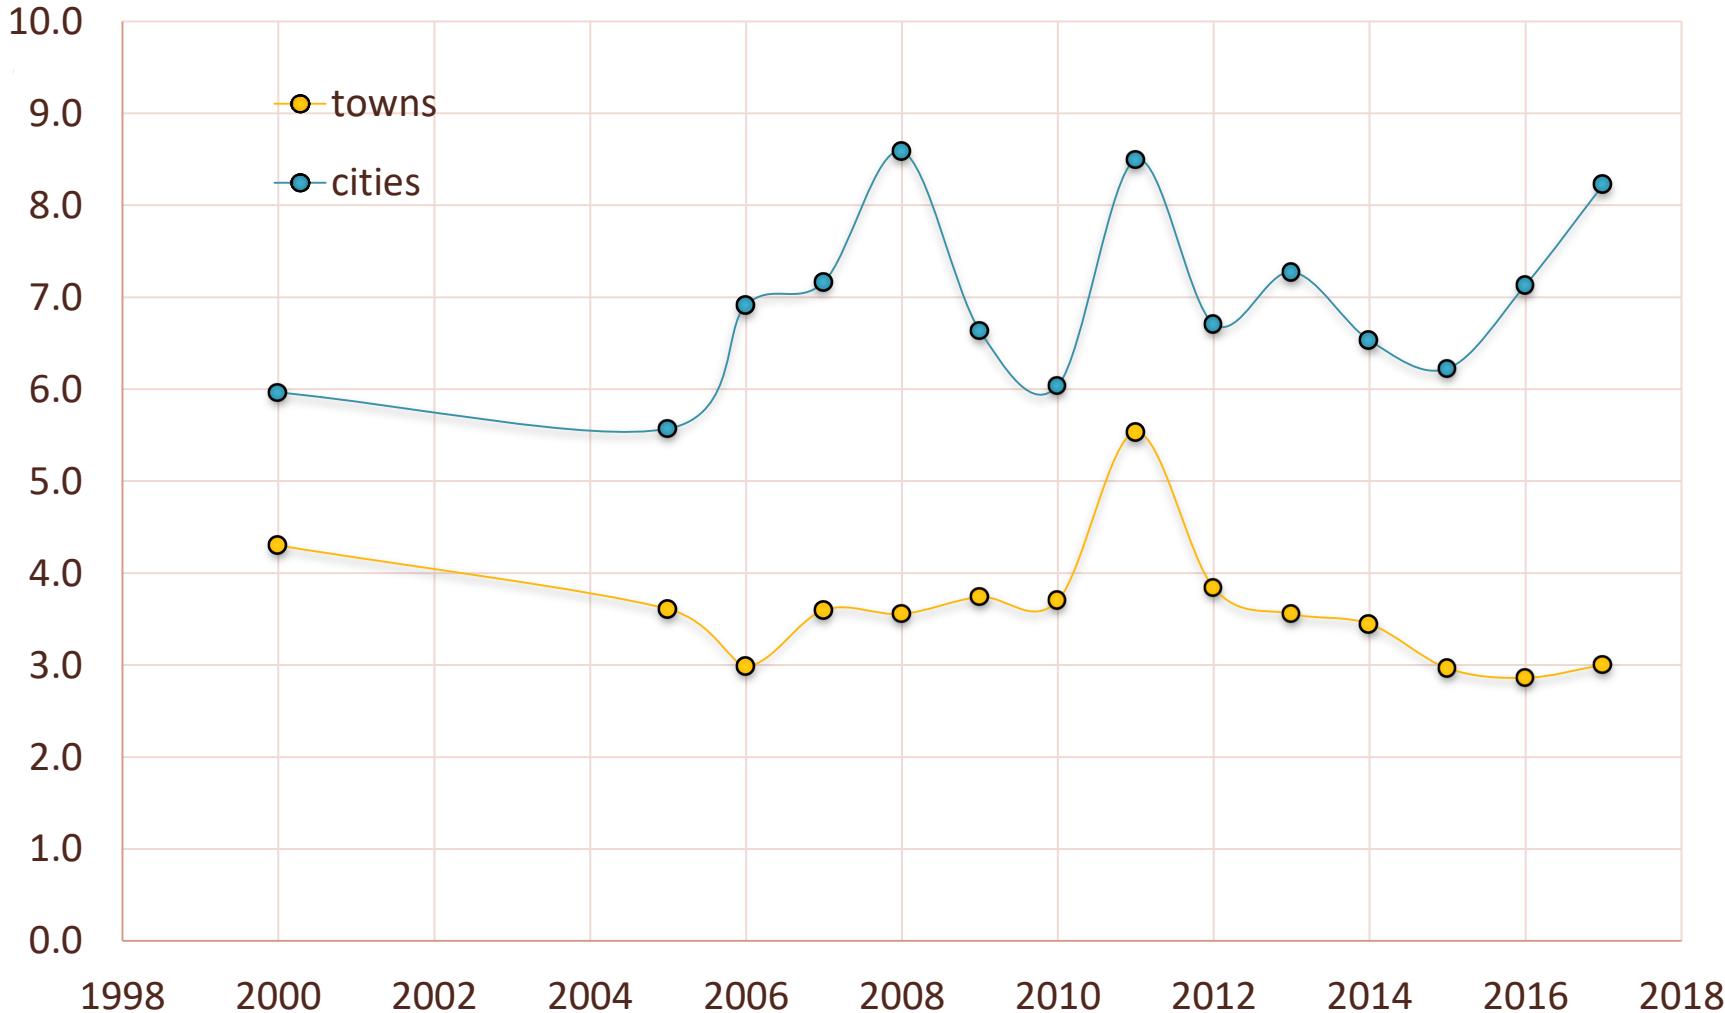

Mortality trends by rural/urban (unadjusted e_0^t)

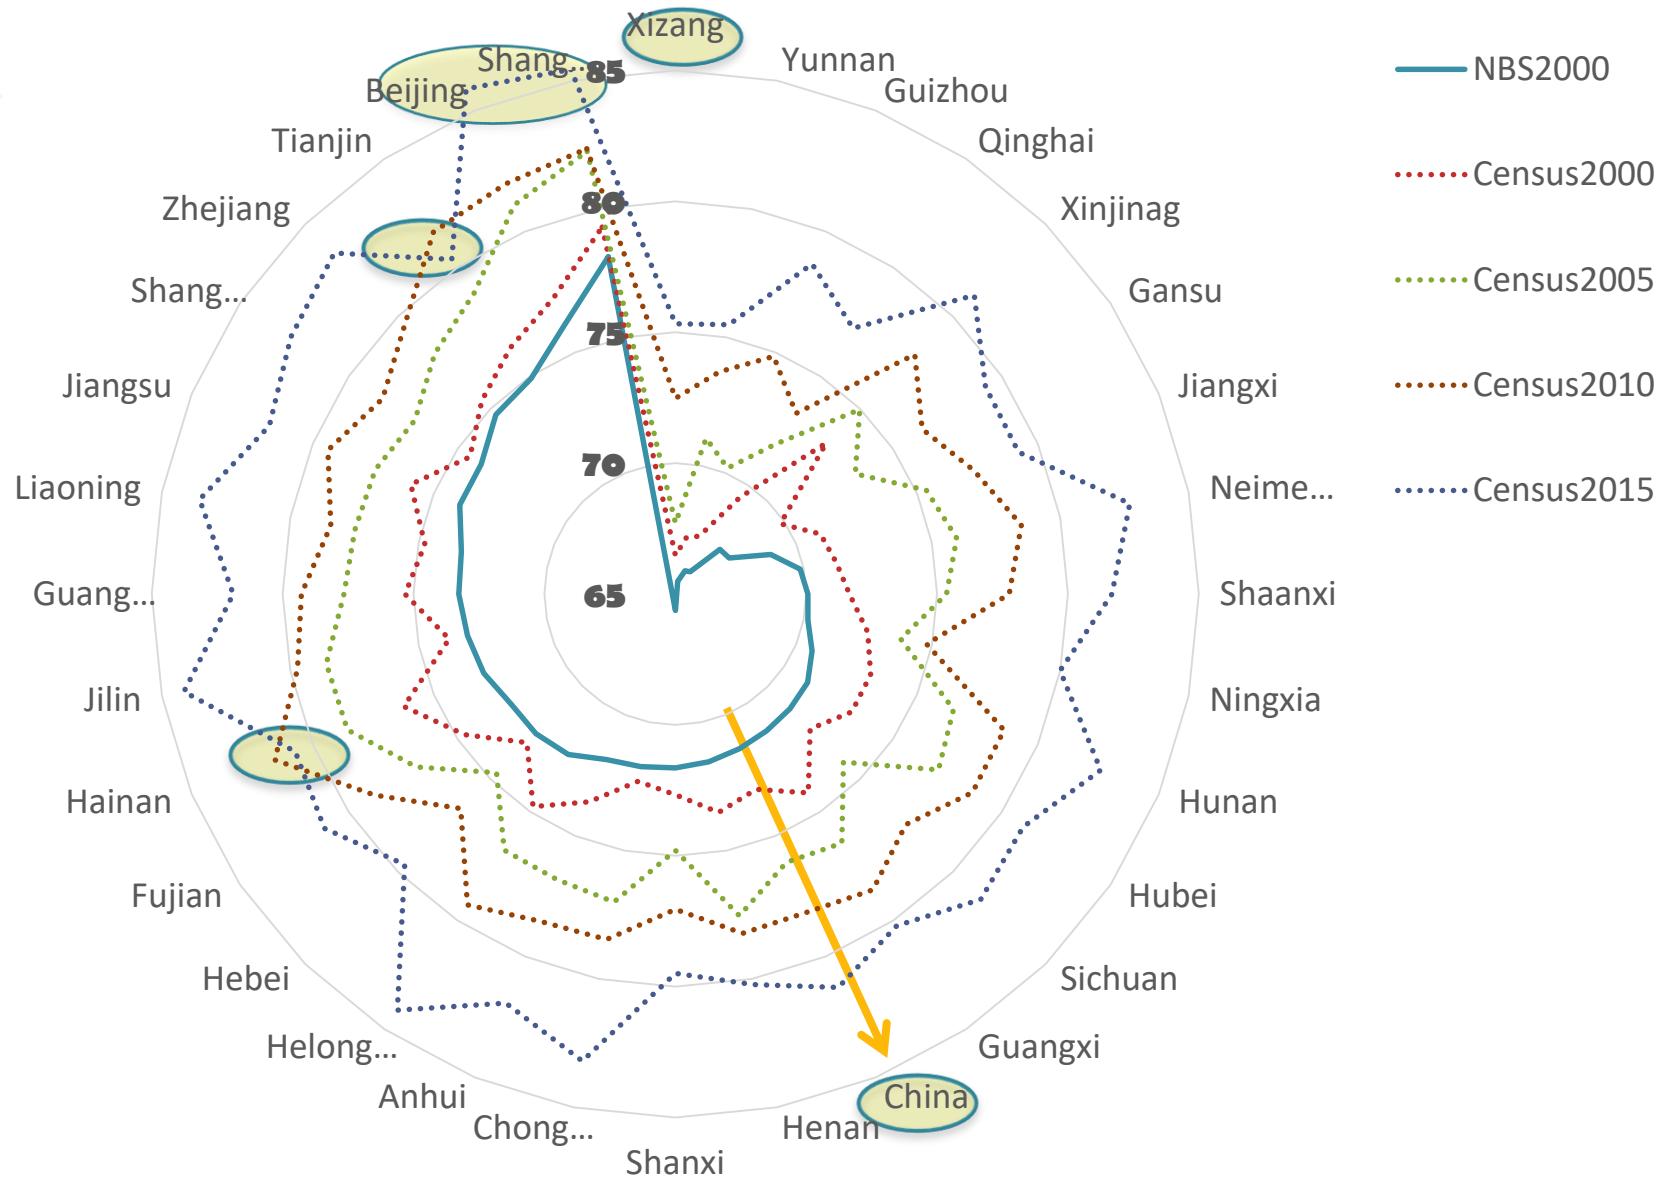

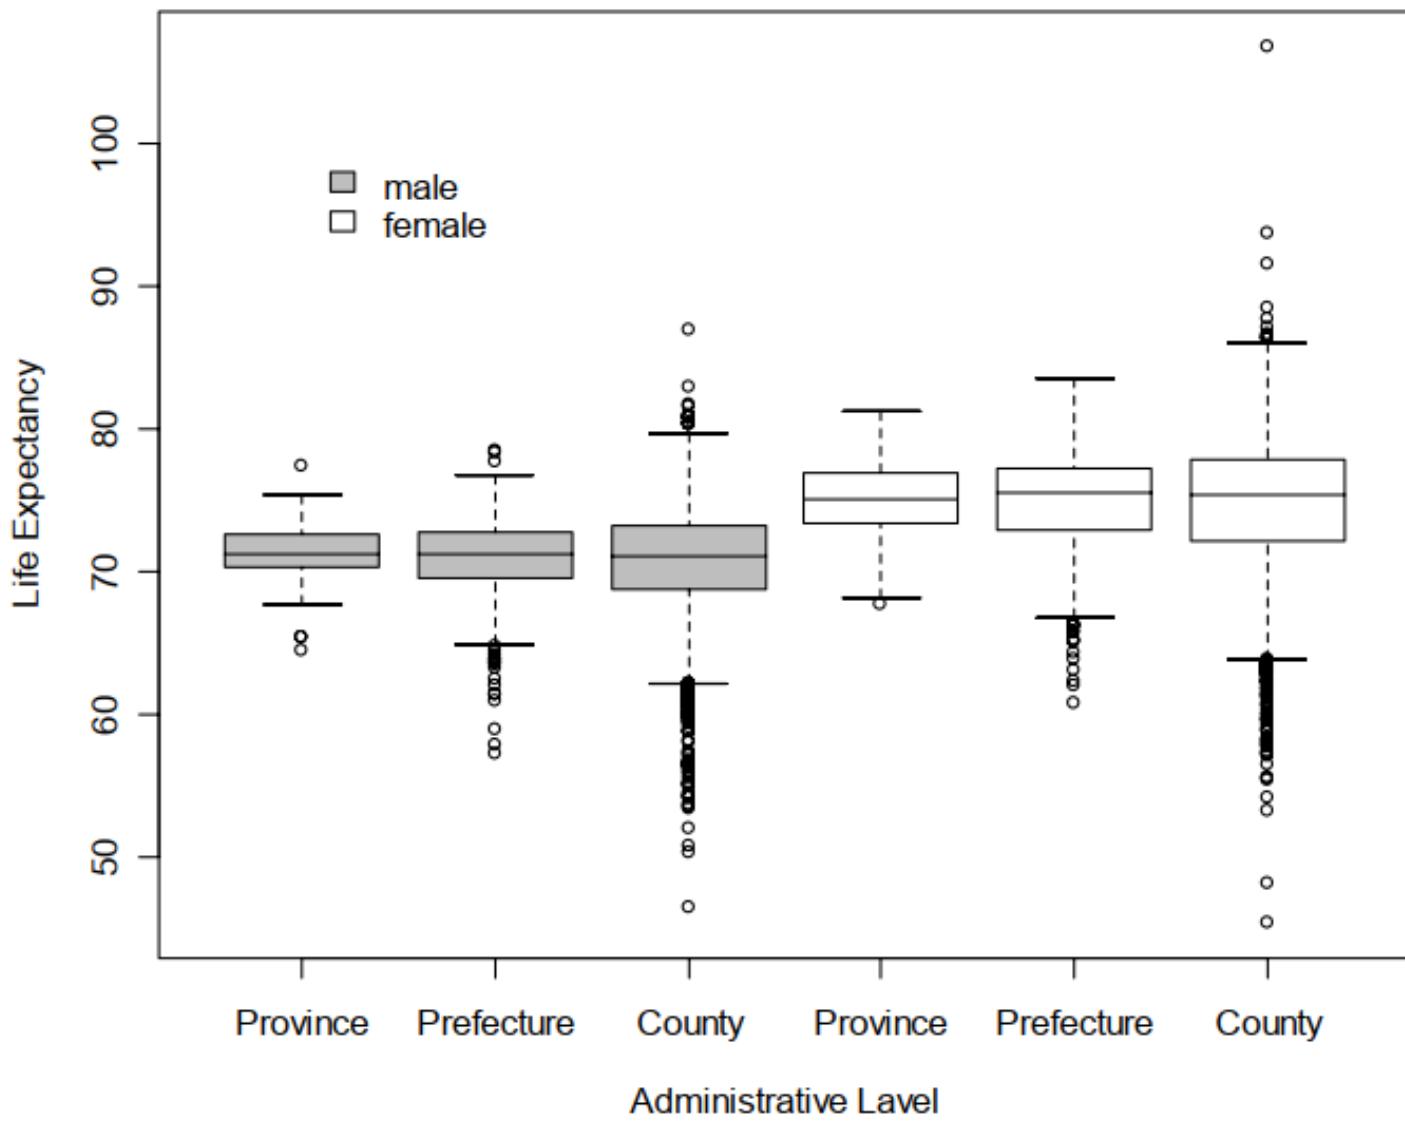

Mortality trends: rural/urban gap (e_0^t) comparing to e_0^t for villages

Regional trends and variation, e_0^t

Mortality variation: e_0 (2000, unadjusted)

Mortality variation: county level e_0 (2000, raw)

Variable	Percentile							
	Mean	S.D.	Min	5	Med	95	Max	
e_0^m	69.9	3.9	46.4	62.9	70.5	75.3	86.9	
e_0^f	73.8	4.7	45.3	65.4	74.5	80.0	106.7	
${}_1q_0^m$	25.7	23.4	0.0	4.6	22.9	91.1	376.7	
${}_1q_0^f$	32.8	32.0	0.0	4.9	18.9	68.6	307.3	

Brass Logit Model Smoothing

- Brass (1971) relational model: linear relationship between l_x 's of an observed population and of a standard population at logit scale

$$\text{logit}(l_x) = \alpha + \beta \cdot \text{logit}({l_x^s})$$

- Consistency of mortality across different age groups
- Choice of standard life table: “must be some kind of average Brass (1971)”. We use provincial average.

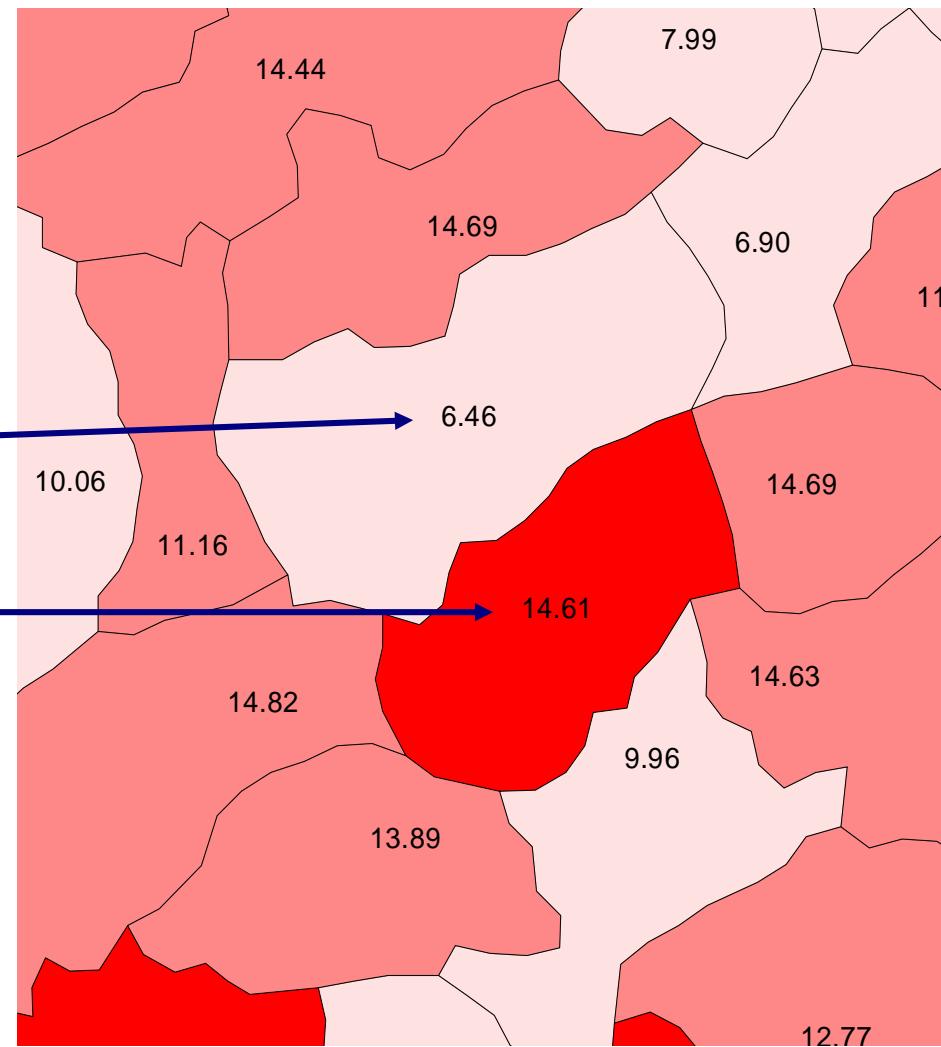

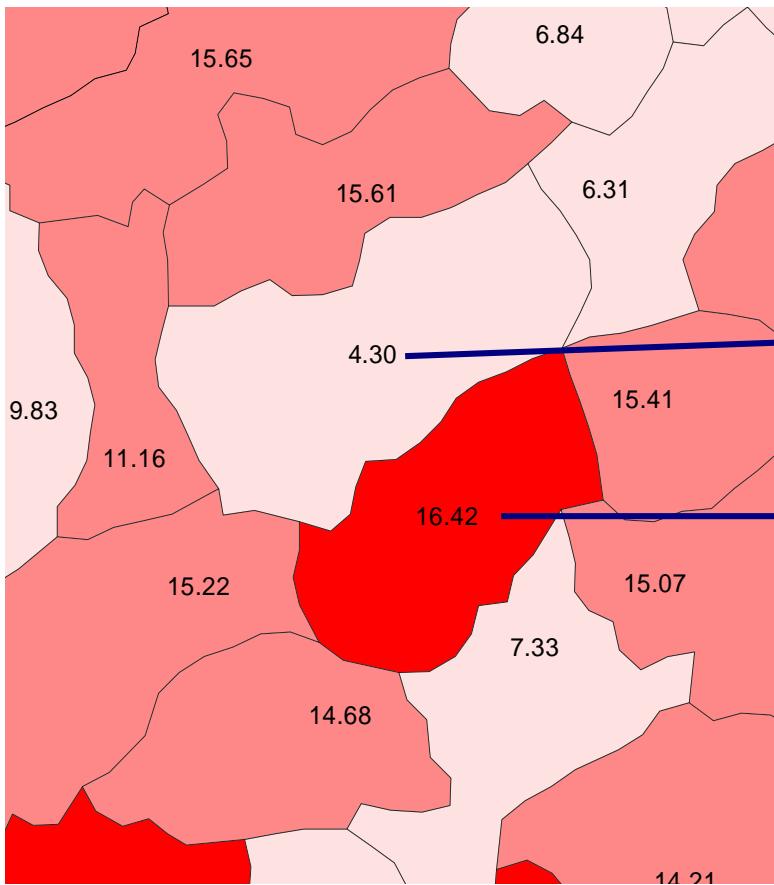

Empirical Bayes Estimates

- Empirical Bayes Estimates (Efron and Morris 1973, 1975; Clayton and Kaldor 1987; Marshall 1991): pool information across areas to produce more stable and robust estimates using the Empirical Bayes methods.
- Information from neighboring units serves as *priori* for the local estimate.

$$\hat{\theta}_i = m_n + \frac{S^2 - \frac{m_n}{\bar{n}}}{S^2 - \frac{m_n}{\bar{n}} + \frac{m_n}{n_i}} (m_i - m_n)$$

Empirical Bayes Estimates

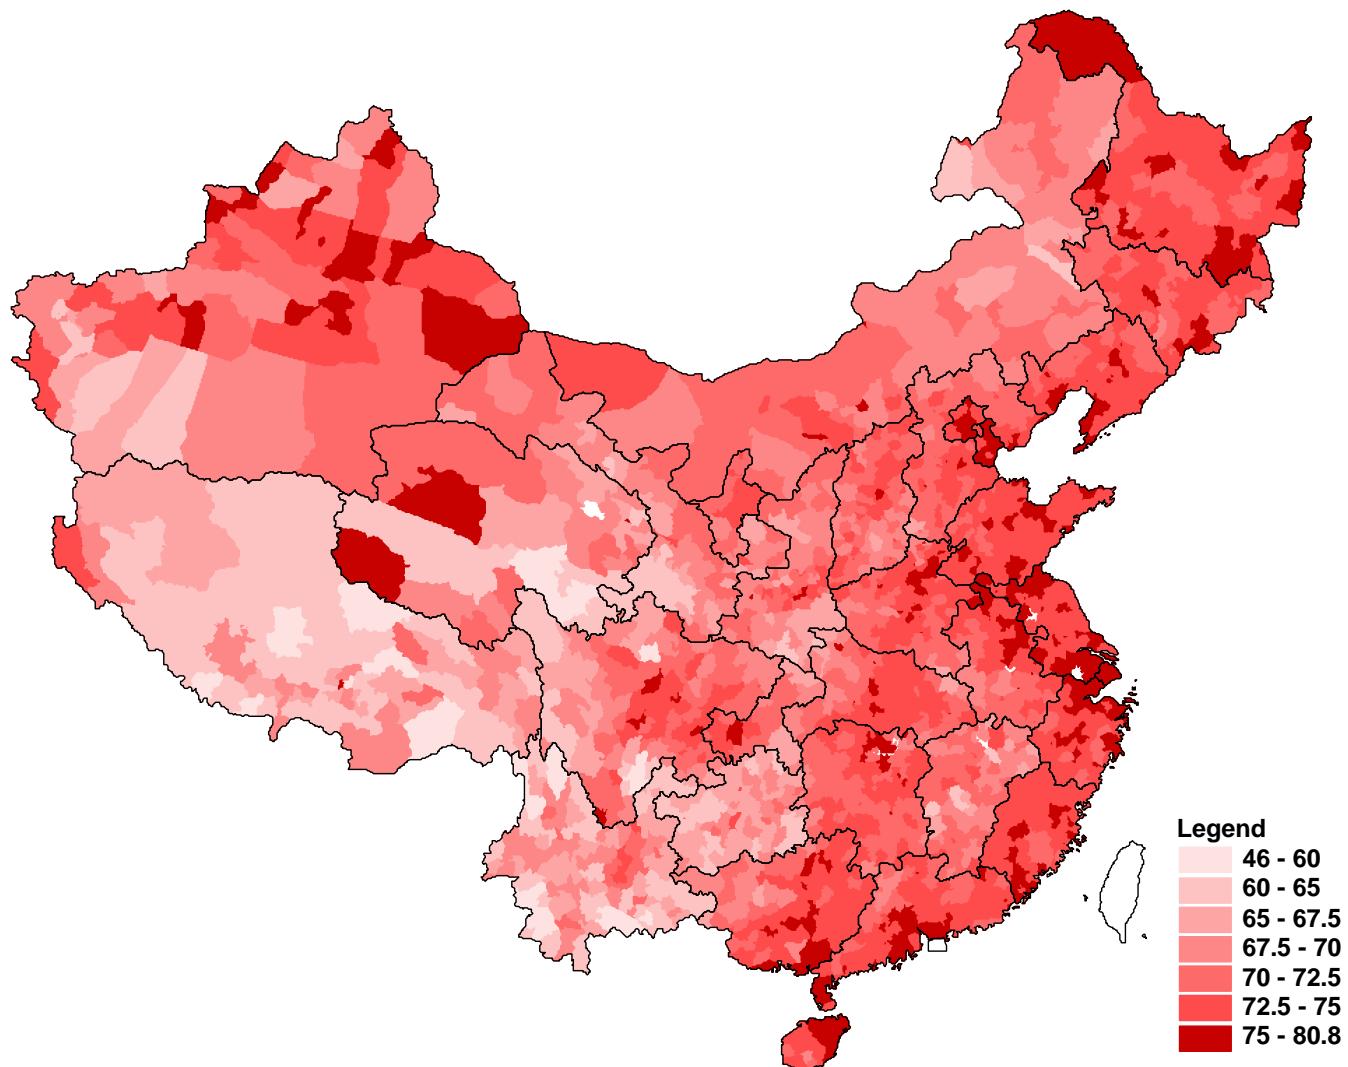

Mortality variation: county level e_0 (2000 smoothed)

Variable	Percentile							
	Mean	S.D.	Min	5	Med	95	Max	
e_0^m	69.8	3.7	46.6	62.9	70.5	74.5	79.3	
e_0^f	73.4	4.2	45.5	65.3	74.3	78.6	84.0	
${}_1q_0^m$	26.0	22.1	0.9	6.1	23.8	93.0	355.2	
${}_1q_0^f$	33.6	31.3	1.2	6.6	19.2	66.9	267.7	

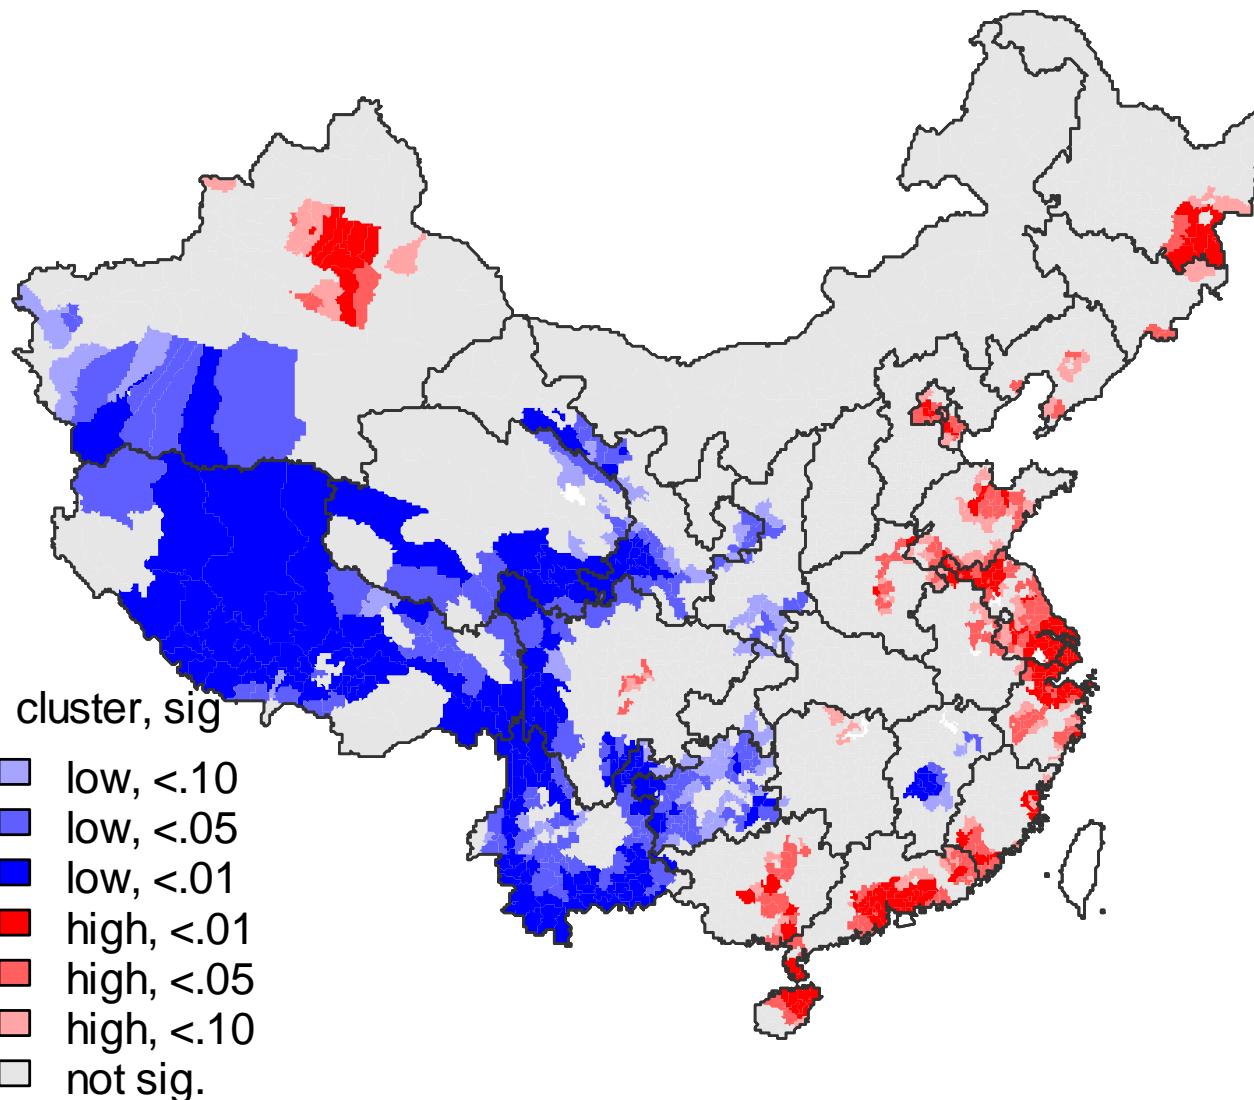

Mortality variation: county level e_0^t (2000)

Mortality variation: county level e_0^f clusters (2000)

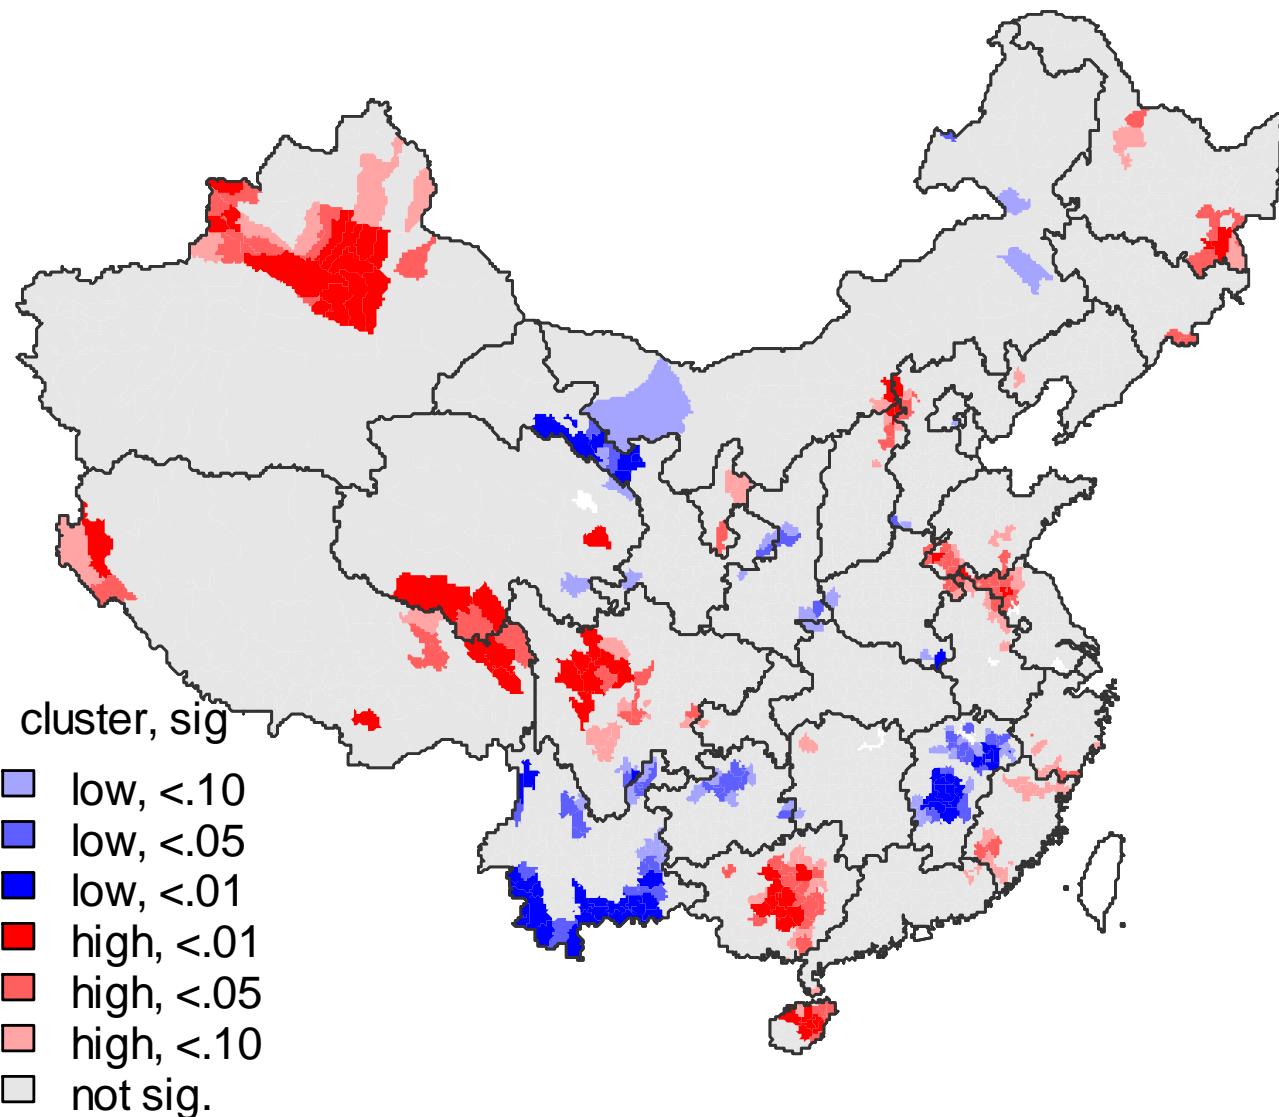

Mortality variation: e_0 2000 regression

*** denotes p<.001; ** denotes p< .01; * denotes p< .05

Mortality variation: county level e_0^f (2000)

Mortality variation: observations

- Huge regional variation: China is a world of its own!
- Regional variation is relatively stable
- Regional differences are largely driven by developmental factors

Next Steps

- A model/system simultaneously estimating fertility, mortality, population age structure using all available survey/census data to consistently estimate demographic parameters.
- Subnational evaluation
- HMD standards/protocols

Thank you!
